

Project Proposal

Problem statement

First Jobbers are frequently targeted by scammers who exploit the vulnerabilities of starting a career—such as fake recruiters deceiving them into transferring equipment fees and filling out bogus job applications. The most critical issue is that this represents a "compounded threat": scammers seek not only money, but also harvest personal data to resell or exploit for identity theft, with extra-income scams already accounting for 162,335 suspended accounts (23.23% of all suspensions) [3]. These attacks typically manifest as Authorized Push Payment (APP) Fraud—costing Thailand THB 1.8 billion in Q2/2026 alone [4]—leveraging social engineering to induce panic and manipulate victims into self-authorizing transactions. Traditional security systems fail to prevent this because they lack the contextual awareness to recognize that the transaction is stripping away both their "last safety net" (with 77.3% of Thais having emergency savings lasting less than 6 months) and their "personal data security" simultaneously.

Proposed solution

One solution is K-SafeFirst, a feature with the following capabilities:

Cognitive Fraud Defense

An AI-driven system that detects abnormal transactions to protect users from scams:

- Career Mode: Secures funds in a K-ePOCKET "Emergency Wallet" while analyzing real-time risks via Graph & Metadata analysis (e.g., fund sources, new payees, cumulative transfers, destination risk).
- Intervene: Applies 3-level friction based on transaction risk:
 - LOW (Normal): Standard patterns with no scam indicators; proceeds normally.
 - MEDIUM (Review Required): Moderate risk signals detected (e.g., first-time transfers, emergency fund withdrawals, abnormal timing/amounts, or job-related payments). The system displays a contextual warning with 2–3 reasons for intentional review before proceeding.
 - HIGH (High Risk): Severe indicators detected (e.g., mule account networks via transaction graphs, rapid pass-through transfers, or blacklisted accounts). The system immediately halts the transaction before funds leave the account—either temporarily holding it for re-evaluation or rejecting it per bank policy if confirmed fraudulent.
- Smart Delay Transfer: Temporarily holds funds in a central system for risky transfers, allowing users a grace period to cancel.
- Trusted Contact Approval: Bypasses screening for pre-approved contacts and verified entities (e.g., hospitals). Additionally, if abnormal activity occurs, the system will send emergency alerts specifically to your designated trusted contacts.

K-ePOCKET

A savings management system designed for First Jobbers in the form of an easy-to-manage Cloud Pocket, featuring automated benefit calculations to eliminate the hassle of monthly savings tracking. The details are as follows:

- Goal-Based & Auto-Allocation: Users can set an emergency fund goal (3–6 months) and automate their savings by scheduling recurring transfer amounts and dates into the "Emergency Wallet" within K-ePOCKET. The system offers high flexibility, allowing users to adjust, pause, or cancel deductions at any time.
- Micro-Tiering Interest: Incentivizes savings through a tiered interest rate structure:
 - First : 1 – 10,000 THB: Earns a special 2.0% interest rate
 - Second :10,001 – 100,000 THB: Earns a 1.5% interest rate
 - Third : Portion exceeding 100,000 THB: Earns a 0.25% interest rate
- K-Point Reward & Save Point Milestone: Awards bonus K-Points to users who maintain their emergency savings without making any withdrawals for 6 consecutive months. This fosters financial discipline and creates strong psychological friction against withdrawing funds for scammers.

Target user

First Jobbers aged 22–30: Individuals who are currently applying for jobs, awaiting onboarding, or anticipating their first paycheck, and have opted into K-SafeFirst to build their emergency savings. The real vulnerability of this demographic does not stem from ignorance, but rather from their "Transitional Context." Navigating the uncertainty of awaiting employment or their initial salary creates intense anticipation and high pressure. Scammers exploit this emotional vulnerability to easily deceive them into transferring funds or handing over personal data. Our system is therefore specifically engineered to safeguard them during their most vulnerable phase.

Value Proposition

For First Jobbers:

- Protect Precious Funds: Intervenes against flawed decisions when users are under panic-driven states.
- Seamless Discipline Building: Automates savings deductions integrated with gamification (K-Points / Tiered Interest).
- Transparency and Auditability: Provides clear explanations for warnings along with a reliable emergency channel (Break-glass) for bill payments, ensuring peace of mind rather than feeling restricted.

For K PLUS:

- Elevate from Awareness to Pre-loss Intervention: Shifts from passive warnings to active intervention, stopping damages before funds leave the system.
- Drive Low-Cost Deposits (CASA Growth) and Engagement: Attracts deposits to the bank and fosters continuous application usage (Daily Active Users - DAU) through milestones and reward systems.
- Massive Cost Savings : Reduces hidden operational costs associated with fraud, such as call center investigation expenses and dispute resolution handling fees.
- Scalable Feasibility: Built upon existing fraud control systems and K-ePocket infrastructure, establishing traceable audit trails and backward-verifiable reporting pathways.

Track Perspective

The K-SafeFirst solution focuses on tackling Authorized Push Payment (APP) fraud—where users are socially engineered into self-authorizing transfers—by implementing a "Defense in Depth" strategy before funds leave the account. This directly aligns with the track's objectives as follows:

- Detect Suspicious Behavior: Develops an advanced risk assessment engine that goes beyond conventional blocking by evaluating cumulative transfer amounts to counter smurfing tactics (where scammers manipulate victims into splitting transfers into smaller sums), combined with Graph analysis and metadata to evaluate destination accounts.
- Alert and Build Confidence: When risk is detected, the system intervenes with transparent, explainable alerts and operates under Data Minimization principles to ensure privacy and build digital trust.
- Ultimate Risk Mitigation via Friction & Delay: The system utilizes AI to analyze Proxy Data (e.g., sudden large withdrawals transferred to unknown accounts) to assess the risk of the user experiencing an Amygdala Hijack (panic-driven state). Upon detection, it triggers a Smart Delay Transfer to temporarily hold the funds in a central system, buying time for the user to regain composure. This is combined with Trusted Contact Approval, bringing in a designated third party to verify the transaction's safety, effectively isolating manipulated decisions from the user's crucial savings.
